

BATTERY CARE INSTRUCTIONS

Cold temperatures can be harmful to electric golf car batteries. Performing the following simple maintenance procedures will help to avoid replacing damaged batteries.

1) **KEEP YOUR CAR CHARGED MONTHLY.**

Charging the vehicle monthly will lower the chance of frozen or dead batteries. Charge your car monthly whether you are using it or not. You must unplug the charger from your car and re-insert it in order to reactivate the charger. Damaged batteries must be replaced while dead batteries can often times be jumped. The batteries must give off 20v or more to kick the charger on. Be sure to do this in a well ventilated area.

2) **MAINTAIN WATER LEVELS IN YOUR BATTERIES.**

Fill each chamber with distilled water. Leave about ½” to 1” gap of air at the top of each chamber to allow the battery to “breathe”. Not filling the batteries with water will cause the batteries to go dry and destroy them.

3) **CLEAN YOUR BATTERY CONNECTIONS.**

With the caps securely in place, take a garden hose directly to the top of the batteries to clean any corrosion (light blue and chalky) or dirt off of the battery cables. A quick brush with a stiff brush will knock off any stubborn debris. Overfilling the batteries with water can result in battery acid leaking from the top and corroding the connections.

4) **IF YOU HAVE A 48V CART WITH A CONVERTER...**

The converter will run the batteries down while the cart is idle. To avoid this from happening remember to:

- Turn the key to the off position whenever the cart is idle.
- Move the toggle switch under the seat to tow/maintenance mode if the car is not being used for 3+ consecutive days.
